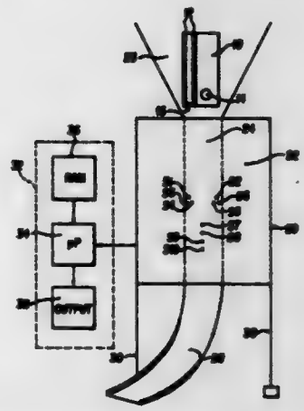
Int. Cl.[5] G06K 7/10, 13/67
U.S. Cl. 235—458 9 Claims



1. A punchcode reader for reading encoded information from a dosimeter having an array of punchcode holes therein having a pattern of open and closed holes representative of data and further having an index notch therein at one end of the array of punchcode holes, said punchcode reader comprising:

(a) a housing defining a vertical passage into which said dosimeter is inserted and will fall by gravity through the passage;

(b) photosensor detector means, disposed adjacent to said passage along the path of travel of said dosimeter, for detecting said array of punchcode holes and said index notch during the travel of said dosimeter through said passage thereby producing output data;

(c) processing means connected to said photosensor detector means for receiving and processing said output data, for determining the orientation of said dosimeter within said passage, for calculating the velocity of said dosimeter as it falls through said vertical passage, and for decoding said output data corresponding to said patterns of open and closed holes of said array and said velocity calculation.

1. In a data terminal having a reader assembly for reading a data carrier having at least one data track formed thereon and having a predetermined track width,

a read head having a data pickup transducer on a front face thereof, said transducer having a pickup area with a width generally comparable to said predetermined track width;

a housing assembly including a guide slot formed therein and adapted to receive a lower portion of said data carrier to guide said data carrier during a manual swipe of said data carrier through said reader assembly, said guide slot having card entry and exit points and comprising first and second opposing and substantially straight side wall sections and a bottom wall section, one of said straight side wall sections having an access window therein for admitting said data pickup transducer on said read head into said guide slot; and

read head positioning means for mounting said read head with said data pickup transducer thereon located in said access window in a preselected position relative to said bottom wall section of said guide slot and intermediate said card entry and exit points,

said bottom wall section of said guide slot having an upper wall surface serving to guide one edge of said data carrier and characterized by a downwardly tapering portion extending from an apex point substantially underneath said data pickup transducer toward one end of said guide slot thereby improving the accuracy of registration between said data pickup transducer and said data stripe for accurate detection of data recorded on said data stripe as said data carrier is being swiped through said guide slot.

1. Apparatus for optically scanning successive tracks in an information plane of a record carrier, comprising:

an optical system for generating a main scanning beam and a pair of tracking beams;

a lens system for focusing the three beams on the information plane to form a scanning spot on a track to be scanned and two tracking spots located at both sides of said track; and

at least three detection systems a, b and c for respectively receiving radiation from the information plane produced by the two tracking beams and the main beam, each detection system including at least two detectors;

characterized in that said apparatus further comprises:

adjusting means which is adjustable in position in order to produce corresponding adjustment of the positions of said spots transversely with respect to the track to be scanned; and

an electronic circuit for deriving difference signals P_a, P_b, P_c respectively corresponding to the difference between output signals produced by the detectors of the respective detection system a, b and c, and forming a position signal E_p proportional to the sum of P_a, P_b and KP_c, where K is a constant;

said position signal E_p being representative of the position of said adjusting means.

1. A position detector for a scanning beam comprising:
a. a scanning region;
b. a beam energy sensor arrangement within said scanning region;
c. said sensor arrangement comprising a plurality of rows of sensors;
d. each row of sensors being arranged transverse to the direction of scan of a beam and in end to end relationship from one end of the scanning region to the opposite end of said scanning region;
e. a gap between adjacent ends of said sensors in each row;
f. each row having more than one gap in said scanning region having a pitch defined as the distance between the center of each gap within said scanning region and the center of a respective adjacent gap within said scanning region;
h. the first row of sensors having at least one logic zero sensor and at least one logic one sensor, means for outputting the logic of the at least one logic zero sensor as a single logic zero output and for outputting the logic of the at least logic one sensor as a single logic one output, means for comparing the logic zero and logic one outputs of the first row of sensors and outputting either a logic zero or logic one output, whichever exhibits a greater beam energy value;
i. each row following the first row having at least two sensors representing the same given logic value and at least one sensor representing the opposite logic value, means for outputting the logic value of the at least two sensors as a single logic output, and means for outputting the logic value of the at least one sensor as a single logic output, and means for comparing the logic zero and logic one outputs of each row of sensors following the first row and outputting either a logic zero or logic one output for a respective row, whichever exhibits a greater beam energy value;
j. the sensors of each said row being arranged in alternating logic order;
k. a first group of said plurality of rows having a pitch of one half a scanning beam width or greater;
l. a second group of said plurality of rows following said first group of rows having a pitch substantially equal to or greater than one fourth a scanning beam width but less than one half a scanning beam width;
m. the comparison logic output for each of said first group of rows and the comparison logic output for the first row of said second group of rows representing a bit of information for each respective row;
n. the second row of said second group of rows and the third row of said second group of rows being offset relative to one another and the other preceeding rows;
o. means for comparing said logic output of the second row of said second group of rows with the third row of said second group of rows and outputting either a logic zero or logic one output, depending upon if the comparison matches or is different; and
p. the comparison logic output for the second and third rows representing a bit of information.

1. An all digital phase-locked clock generator for providing a digitally generated clock signal at least one edge of which is phase-locked to a selected edge of a reference signal, the clock generator comprising:

a variable length, digital delay line means for receiving the reference signal and a delay line length signal, delaying the reference signal in proportion to said delay line length signal, and providing the delayed reference signal as said digitally generated clock signal;

digital phase detection means for receiving the reference signal and the digitally generated clock signal, detecting the phase difference between the selected edge of the reference signal and said one edge of the digitally generated clock signal, and providing a digital phase error signal proportional to the detected phase difference therebetween; and

digital delay line length control means, coupled to the phase detection means and to the variable length delay line means, for receiving the digital phase error signal, and providing said delay line length signal comprising a multi-bit address, said digital delay line length control means selectively varying said delay line length signal, in response to the digital phase error signal, by increasing or decreasing a portion of said multi-bit address, to minimize the phase difference between the selected edge of the reference signal and said selected edge of the digitally generated clock signal.

1. Apparatus for the production of a regular microwave field over a relatively great area, comprising:
- a microwave generator including a magnetron;
- a cavity resonator;
- a means of coupling the microwave generator to the cavity resonator;
- a plasma chamber defined by walls;
- a gas introduction means into the plasma chamber;
- a dividing wall of electrically conductive material between the cavity resonator; and the chamber; and
- a coupling system consisting of a plurality of coupling elements in the form of solid bodies, which couples electromagnetic energy from the cavity resonator into the chamber;

characterized in that
- the dividing wall separates the cavity resonator gas-tight from the chamber;
- in the cavity resonator first elements are provided as primary elements of the coupling elements which can absorb the electromagnetic energy from the cavity resonator;
- in the chamber second elements are provided as secondary elements of the coupling elements, which can yield the electromagnetic energy into the chamber; and
- in the dividing wall through-bores having electrically non-conducting closures are provided, electrically conductive connections passing through these closures and to connect the first elements to the respective second elements.

1. A highly sensitive magnetic field detecting apparatus, comprising:

sensing means comprised of a DC superconducting quantum interference device for sensing a magnetic field and producing an output signal corresponding to a magnitude of the magnetic field;

oscillator means for modulating the output signal of the sensing means and generating first and second reference signals for demodulating the modulated output signal of the sensing means;

first phase sensitive detecting means for demodulating the output signal of the sensing means by the first reference signal;

second phase sensitive detecting means for demodulating the output signal of the sensing means by the second reference signal, the second reference signal having a different phase relation than the first reference signal relative to the output signal of the sensing means;

adder means for adding outputs of the first phase detecting means and the second phase detecting means to produce a demodulation signal which is stable against a a phase drift of the output signal of the sensing means; and

signal output means for processing the demodulation signal and for outputting a metering signal corresponding to the magnitude of the magnetic field.

1. A demodulator circuit, comprising:

quasi-coherent detection means, for receiving an IF signal which is phase-modulated in M phases and for frequency-converting said IF signal to a complex signal in a base band by using a complex local signal having a frequency approximately equal to that of a carrier of said IF signal and having sine and cosine components;

A/D converter means for receiving said complex output of said quasi-coherent detection means and for converting the same to a digital signal by sampling said complex output with an externally supplied sample clock timing;

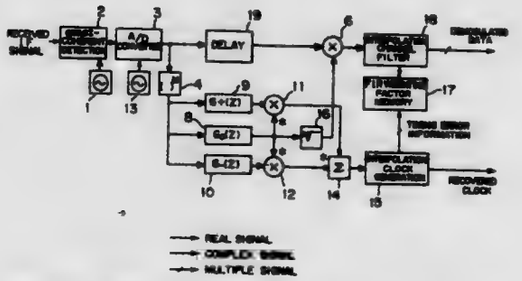
M-th power complex multiplier means for M-th power multiplying said digital signal of said A/D converter means and for producing an output representative thereof;

a set of digital filtering means for receiving and filtering said output of said M-th power complex multiplier means and for producing an output representative thereof;

complex operation means for receiving said output of said set of digital filtering means, and for performing a predetermined complex operation thereon to output signals for coherent detection and clock interpolation;

interpolation clock generation means, responsive to said signals for clock interpolation, for performing clock interpolation in a predetermined manner;

delay means for delaying said digital signal of said A/D converter and for providing an output representative thereof;



complex multiplier means for performing coherent detection of said output of said delay means with said signal for coherent detection;

interpolation channel filtering means for receiving an output of said complex multiplier means and performing an FIR type filtering operation thereon using externally supplied weighting factors;

and weighting factor storage means for storing weighting factors for said interpolation channel filtering means, said weighting factors being determined based on timing error information indicative of a difference between an output phase of said interpolation clock generation means and a phase of said signal for clock interpolation;

said interpolation channel filtering means receiving an output of said weighting factor storage means to calculate an output thereof based on the same, said output of said interpolation channel filtering means being outputted as demodulated data.

1. Resettable switching apparatus for selectively interrupting circuit contacts connecting power from a first terminal to a second terminal when a ground fault occurs, the apparatus comprising:

at least first and second contacts, one of the contacts being movable and the other fixed;

a solenoid housing carrying the movable contact;

first spring means for biasing the solenoid housing away from the fixed contacts for holding the contacts in a normally open position;

a metal footplate in the solenoid housing;

a plunger having a substantially uniformly solid cross section forming the permanent magnet and extending through the structure and slidably mounted in the solenoid housing and having insufficient strength alone to overcome the first biasing means and hold the contacts closed by magnetic attachment to the footplate but which when combined with an electrically generated magnetic field holds the contacts closed;

magnetic field generating means associated with the manually operated plunger for electrically generating a magnetic field which in combination with the magnetic field of the permanent magnet is sufficient to hold the first and second contacts in the closed relationship; and

circuit interrupting means for interrupting the electrically generated magnetic field to open the first and second contacts when a fault occurs.

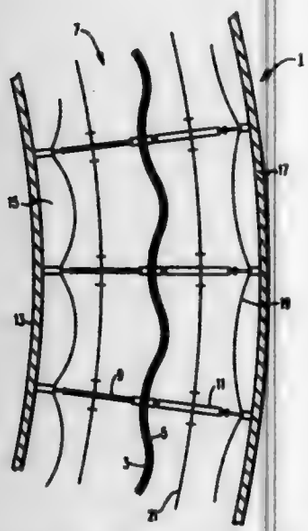
external support means reacting against readily inward and outward forces acting on said inner and outer walls of said vessel respectively;

a solenoid coil immersed in said cryogenic fluid in said vessel and having at least first and second winding layers each comprising conductor means forming multiple axially aligned turns, said conductor means of said at least first and second winding layers of said solenoid coil producing a net inward radial force and relative axial movement between said solenoid coil and vessel as said conducting means are cooled down by said cryogenic fluid in said vessel without current applied to the conductor means, and with current applied to said solenoid coil generating a net outward radial force and axial forces tending to axially compress said turns of each layer of the solenoid coil;

a plurality of first finger plates interleaved with and engaging the conductor means of said first winding layer of said solenoid coil;

a plurality of second finger plates interleaved with and engaging the conductor means of said second winding layer of said solenoid coil;

first mounting means mounting each of the first finger plates at one end to the inner wall of said vessel with the other



the end of the first finger plates extending radially outward and interleaving with said conductor means of said first winding layer of said coil;

second mounting means mounting each of the second finger plates at one end to the outer wall of said vessel with the other end of said second finger plates extending radially inward and interleaving with said conductor means of said conductor means of said second winding layer of said solenoid coil; and

electrically insulating spacer means between said conductor means of said at least first and second winding layers of said solenoid coil;

said first finger plates transmitting said net inward radial force from said conductor means to said external support means through said inner vessel wall when said conductor means are cooled down without current applied to said solenoid coil, and said second finger plates transmitting said net outward radial force from said conductor means to said external support means through said outer vessel wall when current is applied to said solenoid coil, and both said first and second elongated finger plates bending in response to said axial forces and relative axial movement between said solenoid coil and vessel.

1. A superconducting coil assembly comprising:

a rigid, generally planar insulating substrate;

a plurality of generally planar insulating layers disposed in a stacked assembly on said substrate;

a plurality of superconducting coil portions each consisting essentially of a thick film of a high temperature ceramic superconducting material and each having a first end and a second end, wherein a first of said coil portions is disposed at an interface between said substrate and said insulating layer adjacent thereto and the remainder of said coil portions are each disposed at an interface between adjacent pairs of said insulating layers, said coils each lying generally within and generally defining a plane; and

a superconducting connecting portion, consisting essentially of a thick film of the same superconducting material as that of said coil portions, connecting each of said first ends except that of said first coil portion to said second end of an adjacent one of said coil portions so that said plurality of coil portions are joined by said connecting portions to form a continuous thick film superconducting coil of right hand or left hand orientation.

1. A fluid controlled switch assembly comprising:

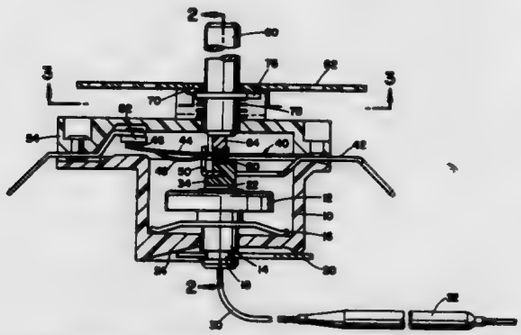
a first housing portion;

a diaphragm assembly including a diaphragm and diaphragm stud received in a well in the first housing portion with the stud extending through an aperture in the first housing portion;

a calibration means for adjustably moving the diaphragm stud axially in the housing aperture;

an electrically conductive spring blade member having an elongated spring portion and a control spring portion, the spring blade member being mounted to the first housing portion adjacent one end of the spring member and including a control member connected with the control spring portion, the control member being operatively connected with the diaphragm such that the connecting spring portion is moved with movement of the diaphragm, the spring portion supporting an electrical make/break means

for selectively making and breaking electrical contact in response to movement of the control member;



an adjustment means which engages the elongated spring member on a surface opposite the diaphragm for adjustably biasing the elongated spring portion.

1. An indicating device for a vehicle comprising:

sensing means, for sensing operating conditions in the vehicle;

drive signal generating means, operatively connected to said sensing means, for generating a first drive signal, said first drive signal having contents corresponding to the operating conditions of the vehicle; and

indicating means, operatively connected to said drive signal means, for providing information concerning the operating conditions of an engine in the vehicle;

said drive signal generating means controlling the providing of said first signal provided to said indicating means;

said drive signal generating means including, abnormal condition detecting means, operatively connected to said sensing means, for detecting an abnormal condition in the operating conditions of the vehicle sensed by said sensing means, said abnormal condition detecting means causing said drive signal to be replaced with a second drive signal when said abnormal operation condition is detected, said second drive signal having predetermined contents which are constant and do not vary in accordance with the operating conditions of the vehicle, so that said indicating means provides information by a multi-level positioner indicator that indicates information solely that said abnormal operation condition is present in place of the information of the operating conditions.

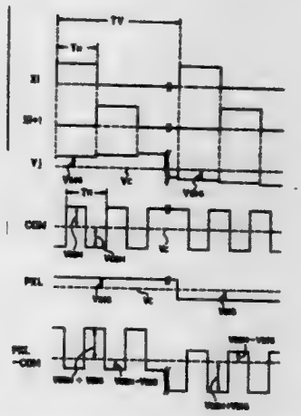
a) selectively turning on said switching elements by applying selection signals to said scanning signal lines of said active type liquid crystal display;



b) supplying picture signals to picture signal lines connected to said pixel electrodes through said switching elements; and

c) providing an alternating voltage that changes polarity within each vertical interval period as at least one of:

i) a common voltage at said common electrode, and

ii) a stick capacitor voltage supplied to said capacitive elements,

wherein the ratio of a change in liquid crystal light transmittance to a change in picture signal voltage is smaller than the ratio of the change in liquid crystal light transmittance to a change in effective voltage applied to a respective said liquid crystal layer.

1. A passive ranging system for determining the distance from a radio-silent ground station to a drifting radiosonde, comprising in combination:

first receiver means within the radiosonde for detecting range tone signals of constant frequency transmitted from remote radio beacons at diverse geographic locations of known finite distances relative to the ground station, each of the signals being unique to a respective beacon;

oscillator means within the radiosonde for providing data tone signals of frequencies indicative of ambient meteorological data;

transmitter means within the radiosonde coupled to said first receiver means and said oscillator means for retransmitting the unique range tone signals;

second receiver means at the ground station for detecting the retransmitted unique range tone signals;

third receiver means at the ground station for detecting the unique range tone signals transmitted by wireless links from said beacons;

selector means coupled to said third receiver means for providing an output of one of the unique signals and an address signal corresponding thereto;

filter means coupled to said selector means for providing an output of the unique signal corresponding to the address signal;

first and second phase-lock loop means respectively coupled to said selector means and said filter means for sampling and tracking at selected intervals the output signals thereof;

comparator means coupled to said first and second loop means for providing an output of the phase lag between the sampled and tracked signals;

generating means providing outputs of the direction from the ground station to the radiosonde, and of the distance between the ground station and the beacon transmitting the selected unique signal; and

computer means coupled to said comparator means and said generator means for providing an output of the distance from the ground station to the radiosonde as a function of the generating means signals and the phase lag;

whereby the position and presence of the ground station is undetectable by radiolocation.

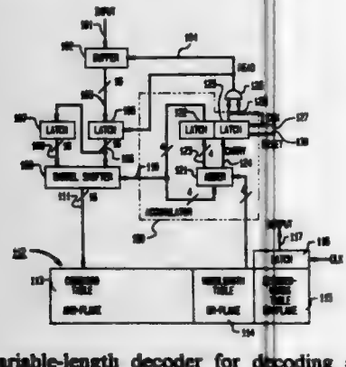
U.S. Cl. 341—67 18 Claims



1. A variable-length decoder for decoding an input bit stream of variable-length codewords during each cycle of a fixed clock comprising:

first and second cascaded bit storage means each having a bit capacity for storing fixed-length parallel sequences of bits from said input bit stream that are equal in bit-length to at least the longest-length variable-length codeword, said first and second bit storage means providing on parallel output leads a consecutive sequence of bits from said input bit stream that is equal in length to at least twice the longest-length variable-length codeword;

a barrel shifter having parallel inputs connected to said parallel outputs of said first and second bit storage means and a plurality of parallel outputs, said plurality of outputs being equal to at least the number of bits in the longest-length variable-length codeword, said barrel shifter providing on its parallel outputs a directly slidable decoding window of a subsequence of consecutive bits in said first and second storage at its parallel inputs, the position of said decoding window being determined during each clock cycle by an applied control signal;

table-lookup memory means connected to the outputs of said barrel shifter, said table-lookup memory means having a stored input entry for each variable-length codeword and stored corresponding output entries for the length of each variable-length codeword and for the fixed-length codeword associated with each variable-length codeword, said table-lookup memory means for decoding a variable-length codeword by matching the initial bits in said subsequence of bits in the decoding window of said barrel shifter with a variable-length codeword entry and for producing a first output equal to the corresponding stored fixed-length codeword and a second output equal to the corresponding stored codeword length; and

accumulator means for adding during each clock cycle the length of the decoded variable-length codeword with the accumulated codeword lengths of variable-length codewords decoded during previous clock cycles, said accumulator means generating said control signal during each clock cycle to directly shift the decoding window of said barrel shifter by the number of bits in the decoded variable-length code word to the beginning of the next undecoded subsequence of bits at the inputs to said barrel shifter, and for generating a read signal when the accumulated codeword lengths indicate that all the bits in said first bit storage means have been decoded, said read signal transferring the bits in the second bit storage means into the first bit storage means and to read in the next parallel sequence of input bits into the second bit storage means, whereby the decoding window of the barrel shifter is directly shifted to begin at the first bit in the first storage means that is not yet decoded.

1. A target locating and ranging system, comprising:

means for transmitting signal toward a target;

monopulse receiving means for generating sum and difference monopulse receiving beams directed along a boresight axis, and for responding to signal echoes from said target with received sum and difference signals;

auxiliary receiving means associated with said monopulse receiving means for generating an auxiliary receiving beam directed at an angle relative to said boresight axis, and for responding to signal echoes from said target with a received auxiliary signal;

weighting signal generating means coupled to said monopulse receiving means and to said auxiliary receiving means for processing received sum, difference and auxiliary signals in the presence of unwanted signals for generating a first weighting signal which, when multiplied by said auxiliary signal, results in a first weighted auxiliary signal approximately equal in magnitude and in a predetermined phase relative to said sum signal, and for generating a second weighting signal which, when multiplied by said auxiliary signal, results in a second weighted auxiliary signal approximately equal in magnitude and in a predetermined phase relative to said difference signal;

weighting means coupled to said monopulse receiving means, to said auxiliary receiving means, and to said weighting signal generating means, for weighting said auxiliary signal with said first and second weights to produce said first and second weighted auxiliary signals;

summing means coupled to said weighting means and to said monopulse receiving means for summing said first weighted auxiliary signals with said received sum signals to produce adapted sum signals, and for summing said second weighted auxiliary signal with said received difference signals to produce adapted difference signals, thereby generating a null in the effective sum and difference beams at the location of said unwanted signal, but thereby distorting said effective sum and difference beams;

ratio generating means coupled to said receiving means and to said auxiliary receiving means for generating an adapted monopulse ratio signal representing the ratio of said adapted difference signal divided by said adapted sum signal;

signal processing means coupled to said weighting signal generating means and to said ratio generating means for selecting one of a plurality of monopulse error functions in response to said adapted monopulse ratio, and for applying said adapted monopulse ratio signal to said one of said error functions for determining the angle of said target from said boresight axis.

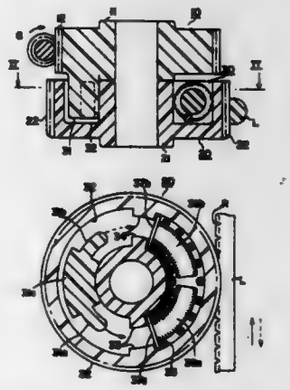
U.S. Cl. 343—903 **1 Claim**



1. A device for driving a telescopic power antenna characterized in that said device includes: a disk-shape drive-side base which is caused to rotate by a motive force of a motor; a disk-shape driven-side base which is concentrically provided adjacent to the drive-side base and causes an antenna element to extend and retract when rotated; and a rotary force transmission mechanism interposed between the drive-side base and the driven-side base to transmit a rotary force of the drive side base to the driven-side base, said rotary force transmission

mechanism comprising a groove formed in a circumferential direction on one of facing surfaces of said two bases, a coil spring installed in a specific area of the groove so that the coil spring expands and contracts in the direction of the length of the groove, and a projection formed on the other of the facing surfaces of the two bases so as to cause a compressive deformation of the coil spring when a relative rotation occurs between the drive-side base and the driven-side base; and wherein elastic cores made of rubber are installed in an internal hollow space of the coil spring, said coil spring and elastic cores being arranged so that they are caused to undergo compressive deformation by a specific displacement-pressure relationship made by the movement of the projection when a relative rotation occurs between the drive-side base and the driven-side base.

1. A spectroscopic method for measuring the concentration of a gas in a gas sample, the method comprising the steps of:

intensity modulating a light of a laser diode and frequency modulating the light by a modulation signal to lock the modulated light to an absorption line of a gas within a reference cell of a predetermined pressure and concentration;

passing the modulated light through the gas sample along a measurement path and through the reference cell;

detecting intensity of the light passed through the gas sample and the reference cell and generating a measurement signal and a reference signal, respectively, representative thereof;

automatically compensating the measurement signal for nongasrelated transmission variations in the measurement path by a first and second demodulating step, and first demodulating step comprising the steps of:

forming a first difference signal between a monitoring signal representative of the modulated light and the measurement signal,

forming a second difference signal between the monitoring signal and said reference signal, and

automatically adjusting a first and second gain level of the measurement signal and the reference signal such that the first and second difference signals are equal to zero with respect to an amplitude of a fundamental frequency of the modulation signal,

said second demodulating step comprising the steps of:

detecting harmonics of the measurement signal and reference signal with respect to the fundamental frequency of the modulation signal;

receiving the compensated and demodulated measurement signal and reference signal and generating a concentration signal which is indicative of the concentration of the gas in the gas sample.

U.S. Cl. 358—105 3 Claims

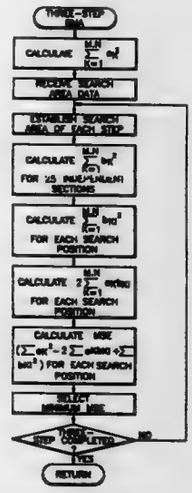
1. A method for detecting a motion vector in an image processing system having an operation means for performing summation and accumulation after multiplication, wherein luminance component data of a current macro block is received and an initial address of a search area is generated so as to detect the motion vector, comprising the steps of:

squaring a brightness value of each pixel of said current macro block and summing up the squared results to produce a first summation value;

receiving search area data of a preceding frame corresponding to said initial address;

establishing a given number of search positions at regular intervals between the pixels in a search area of said preceding frame;

establishing blocks of the same size as that of said current macro block on the search positions so as to square a brightness value of pixels in the established block and to sum up the squared results to produce a second summation value;



multiplying the current macro block by a brightness value of respective pixels corresponding to respective blocks on each search position, summing up the multiplied result to produce a third summation value and doubling the summed result;

adding said first summation value to said second summation value for each search position and subtracting therefrom the doubled result so as to select therefrom a minimum value; and

determining a search position of block having the minimum value as a motion vector in case of completing a three-step search and returning, or otherwise, looping to said fourth step after establishing a given number of search positions at an interval between the pixels narrower than that of a prior step on the search position of block having said minimum value.

1. A method for correcting drift in the level of a video output signal provided by a flying spot telecine, said method comprising the steps of:

scanning a film strip with flying spot so that light passes through the film strip and is received by a photodetector circuit which generates an output video signal as a function of the light received thereby;

causing the flying spot to intermittently scan a perforation area corresponding to the position of one or more perforations in the film strip being scanned so that the output video signal from the photodetector circuit during the scan of the perforation area varies as a function of variations in operating parameters of the telecine; and

adjusting the level of the output video signal generated by the photodetector circuit as a function of (1) the level of the output video signal during the time that the scan of the perforation area takes place and (2) a reference signal which does not vary as a function of variations in the operating parameters of the telecine so as to compensate for the drift level.

a pickup head scanned in the radial direction of said video disc for obtaining a reproduced video signal therefrom;
time base correction means connected to said pickup head for correcting the time base error of said reproduced signal;
signal output means connected to said time base correction means;
a first horizontal oscillator to be used for controlling said time base correction means;
a gray level source for applying a gray level signal to said signal output means;
a second horizontal oscillator separately provided with said first horizontal oscillator for adding a reference horizontal synchronizing signal to said gray level signal;
a sync. separator connected to the input side of said time base correction means for separating a horizontal signal from said reproduced video signal; and
scan reproducing means for scanning said pickup head in the radial direction of the video disc at a higher speed intermittently by means of a series of track jumps, said scan reproducing means selectively and intermittently applying said gray level signal and said reproduced signal to said signal output means in synchronism with said series of track jumps, characterized by
synchronizing means for synchronizing said first horizontal oscillator with the horizontal signal from said sync. separator during said track jumps;
phase detection means for detecting the phase difference between the output signals of said first and second horizontal oscillators during said track jumps; and
control means connected between said phase detection means and said second horizontal oscillator for controlling the frequency of the latter until said phase difference becomes substantially zero.

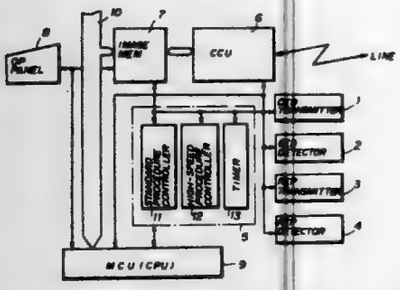
said transmitting station including:
calling means for making a call to said receiving station;

first detecting means for detecting a called station identification signal received from said receiving station;

repeat (REP) means for transmitting a predetermined signal to said receiving station when the called station identification signal is detected by said first detecting means indicating implementation of a high-speed communication procedure;

timer means for detecting whether the called station identification signal received from said receiving station stops within a predetermined time; and

transmission means for starting a facsimile transmission in conformance with the high-speed communication procedure when said timer means detects the stop of the called station identification signal within said predetermined time, said high-speed communication procedure employing a protocol having protocol steps which execute the high speed communication procedure,



wherein said receiving station including:

identification signal transmitting means for transmitting the called station identification signal when the call is received from said transmitting station;

second detecting means for detecting the repeat (REP) signal received from said transmitting station indicating that the protocol is employed in the high-speed communication procedure; and

stop means for stopping the transmission of the called station identification signal when said second detecting means detects the repeat (REP) signal.

means for recording image signals in the recording medium, including

means for sequentially recording analog image signals of different images,

key input means to be operated when the image signals of one image are switched to the image signals of a different image,

timing signal generating means responsive to an operation of said key input means for generating a timing signal representative of a time at which the image signals of said one image are switched to the image signals of said different image, and

means for recording said timing signal in the recording medium as the image signals are recorded; and

means for reproducing image signals recorded in said recording medium, including;

means for detecting the timing signal recorded in said recording medium during reproduction of the image signals,

means for sequentially reading out analog image signals from said recording medium,

means for converting analog image signals read out from said recording medium into digital image signals,

means for storing in sequence single frames of the converted digital image signals until said detecting means detects the timing signal,

means for reading out the converted digital image signals of the last frame stored in said storing means prior to the detection of the timing signals and for gradually decreasing the level of the read out image signals of said last frame from the time said detecting means detects the timing signals to produce decreased digital image signals of said last frame,

means for gradually increasing the level of the converted digital image signals of following frames read out from said recording medium from the same time said detecting

means detects the timing signals to produce increased digital image signals of said following frames,

means for adding the level of the decreased digital image signals with the level of the increased digital image signals to produce digital output image signals, and

means for converting the digital output signals into analog output image signals.

1. A recording position compensation circuit for use in a digital information recording-reproduction apparatus in accordance with the present invention comprising:

advanced reproduction head means disposed at a upstream position in a travelling path of a recording medium;

recording head means disposed at a downstream position in the travelling path of the recording medium;

memory means for successively storing in a predetermined address digital information to be recorded on the recording medium through the recording head means;

offset generation means for generating an offset signal indi-

cating a deviation between standard signal processing time, which is required for a process wherein digital medium information recorded on the recording medium is reproduced through the advanced reproduction head means and re-recorded on the recording medium through the recording head means, and inter-head travelling time which is required for the recording medium to travel a distance from the advanced reproduction head means to the recording head means;

reference read-out sequence generation means for generating a reference sequencing signal indicated a reference of a sequence whereby the digital information stored in the memory means is read out so that a part of the digital medium information is rewritten through the recording head means;

compensation read-out sequence generation means for generating a compensation sequencing signal indicating an actual sequence whereby the digital information stored in the memory means is read out so that a part of the digital medium information is rewritten through the recording head means;

phase difference generation means for generating a phase difference signal which resets the compensation read-out sequence generation means so as to bring about a phase difference between the reference sequencing signal and the compensation sequencing signal, the phase difference corresponding to a deviation indicated by the offset signal; and

address generation means for specifying an address in the memory means required for reading out the digital information stored in the memory means, based on the compensation sequencing signal.

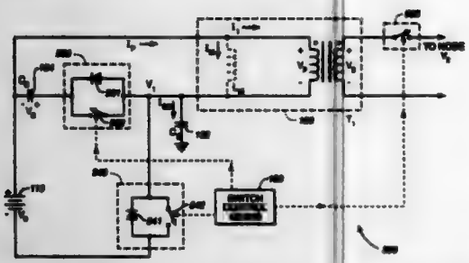
means of said secondary winding and causing a second portion of said energy to be stored in said transformer, said energy stored in said transformer being released from said transformer when said primary switch means is thereafter opened, circuitry for utilizing the energy stored in said transformer to reset the core of said transformer during the time said primary switch means is open and to minimize the voltage stress on said primary switch means when said primary switch means closes, said circuitry comprising:

a storage capacitor;

a first switch means coupled in series with said storage capacitor, the series combination of said storage capacitor and said first switch means coupled in parallel with one of said transformer windings;

a second switch means coupled in series with said secondary winding of said transformer; and



a switch control means for operating said first and second switch means in relation to the operation of said primary switch means, said switch control means closing said first switch substantially when said primary switch means opens and opening said first switch means prior to when said primary switch means closes to create a zero-voltage switching condition on said primary switch means when said primary switch means next is caused to close, said switch control means opening said second switch means substantially when said primary switch means opens and closing said second switch means substantially when said primary switch means closes, said second switch means being operated such that substantially no current is conducted by said secondary winding during the interval after said first switch means is opened and before said primary switch means is closed.

a direct current power bus providing a source of current to be conducted to said motor;

an insulated gate bipolar power transistor selectively conducting transistor current, said transistor having a power gate, and a power emitter terminal, and a power collector terminal operatively connected to said bus and said motor for either conducting transistor current to said motor or from said motor;

a control circuit including;

bias means for selectively supplying a turn on voltage and a turn off voltage to said power transistor;

slow isolation means for connecting said bias means turn off voltage to said power gate to cause said power transistor to slowly cease conducting;

a fast mode circuit switchable to bypass said slow isolation means; including

switchable conduction means for selectively connecting said bias means turn off voltage to said power gate through said fast mode circuit shunting said slow isolation means; and

sensing selection means for sensing whether said power transistor is conducting a transistor current at a normal level and if the transistor current is at a normal level causing said switchable conduction means to connect said bias means turn off voltage to said power gate through said fast mode circuit so that said power transistor rapidly ceases conducting.

1. A method for automatically controlling the traveling

speed of a controlled automotive vehicle, comprising the steps of:

sensing the presence of a preceding vehicle in the path of said controlled vehicle;

controlling the traveling speed of said controlled vehicle according to a first speed control method in the absence of a preceding vehicle in the path of said controlled vehicle, said first speed control method comprising the steps of (a) sensing a driver set speed set by the driver as the desired traveling speed of the controlled vehicle, and (b) controlling the traveling speed of the controlled vehicle so as to minimize the difference between said driver set speed and said actual traveling speed of said controlled vehicle;

sensing the actual spacing between said controlled vehicle and said preceding vehicle when said preceding vehicle is present;

ascertaining a desired spacing between said controlled vehicle and said preceding vehicle when said preceding vehicle is present;

reading a predetermined minimum allowable spacing which is less than said desired spacing;

controlling the traveling speed of said controlled vehicle according to a second speed control method when said actual spacing exceeds said desired spacing, to control an approach of the controlled vehicle to a predetermined one of the group consisting of the desired spacing and the minimum allowable spacing;

controlling the traveling speed of said controlled vehicle according to a third speed control method when said actual spacing is less than said desired spacing, to control an approach to and retreat from the minimum allowable spacing that will minimize the magnitude of changes in traveling speed and deceleration of the controlled vehicle, said third speed control method comprising the steps of (a) calculating a vehicle deceleration value with which to decelerate said controlled vehicle, said deceleration value being calculated such that as said actual spacing approaches said minimum allowable spacing, said traveling speed of said controlled vehicle approaches said traveling speed of said preceding vehicle, and said calculated deceleration value approaches zero, (b) decelerating said controlled vehicle according to said calculated deceleration value, (c) further decelerating said controlled vehicle at a predetermined deceleration value when said calculated deceleration value decreases to a value less than or equal to said predetermined deceleration value and (d) maintaining said controlled vehicle deceleration at said predetermined deceleration value until said actual range exceeds said desired range.

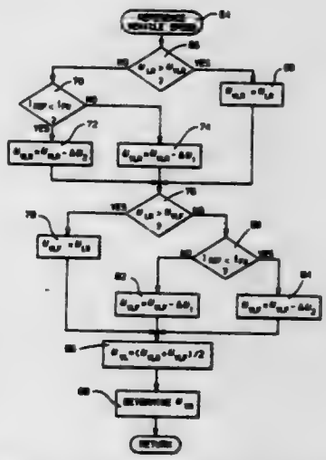
8. A speed reference determining method in an antilock braking system of a vehicle having a pair of rear wheels each traveling over a respective portion of a roadway and in which brake pressure in each on of the rear wheels is individually controlled to prevent wheel lockup by cyclically releasing the brake pressure in response to a sensed incipient lock condition of one of the rear wheels and reapplying the brake pressure following a sensed recovery of said one rear wheel from the sensed incipient lockup condition, the method comprising the steps of:

sensing the speed of each of the rear wheels;

sensing the coefficient of friction of each respective portion of the road surface;

periodically free-wheeling one of the rear wheels to periodically allow its speed to attain actual vehicle speed when (A) the brake pressure thereto is being controlled to prevent the wheel lockup and the sensed coefficient of friction of the respective portion of the road surface is less tan a predetermined threshold while either (A) the brake pressure to the other one of the rear wheels is not being controlled to prevent the wheel lockup or (B) the brake pressure to the other wheel is being controlled to prevent the wheel lockup and the sensed coefficient of friction of the respective portion of the road surface is greater than the predetermined threshold;

alternately free-wheeling the rear wheels to allow the speed of the free-wheeled rear wheel to attain the actual vehicle speed when (A) the brake pressure to each of the rear wheels is being controlled to prevent the wheel lockup



and (B) the sensed coefficient of friction of each of the portions of the road surface is less than the predetermined threshold; and

for each rear wheel, comparing the respective sensed speed with a respective reference vehicle speed that is an estimate of the actual vehicle speed and (A) decaying the respective reference vehicle speed at a predetermined rate when the respective reference vehicle speed is greater than the respective sensed speed and (B) setting the respective reference vehicle speed equal to the respective sensed speed when the respective sensed speed is greater than the respective reference vehicle speed to establish the receptive reference vehicle speed at the actual vehicle speed.

defining, using the processor, a first set of hypothetical particles having a velocity equal to the initial velocity of the maneuverable object and being co-planar with the maneuverable object and the other objects;

projecting, using the processor, trajectories for the first set

of hypothetical particles and for the other objects through time T;

determining, using the processor, a second set of hypothetical particles, from the first set of hypothetical particles, which during time interval T have trajectories which pass no closer than the safe distance to the trajectory of any of the other objects;

finding, using the processor, a third set of hypothetical particles, from the second set of hypothetical particles, to which the maneuverable object can be maneuvered using a corresponding set of maneuvers based on predetermined constraints on the maneuverability of the maneuverable object; and

storing in the memory of the computer system the corresponding set of maneuvers for a elected one of the hypothetical particles from the third set of hypothetical particles.

1. An apparatus for detecting motion of a moving picture, comprising:

an image signal input terminal for inputting an image signal obtained by imaging a three-dimensionally moving object and digitizing an output obtained by said imaging;

an image memory for storing said input image signal;

a storage for storing a three-dimensional model of said three-dimensional object corresponding to a result of an estimation of a three-dimensional motion of said object in a preceding frame of the input image signal;

a delay section for delaying, for one frame period of said input image signal, an image including said three-dimensional object, stored in said image memory;

a blocking circuit for dividing said image from said delay section into a plurality of blocks;

a velocity vector detector for obtaining a velocity vector of said three-dimensional object between each of said blocks and said input image signal read out of said image memory;

a depth coordinate calculator for obtaining depth coordinates for each of said blocks through the use of said three-dimensional model corresponding to the result of estimation of movement of said object in said preceding frame;

a three-dimensional motion parameter estimator for obtaining three-dimensional motion parameters of said three-dimensional object between adjacent frames based on said velocity vector and said depth coordinates of each of said blocks; and

a three-dimensional model controller for adjusting, by the output of said three-dimensional motion parameter estimator, said three-dimensional model to provide an adjusted three-dimensional model so as to assume the same position and direction as those of said three-dimensional object.

1. A multiple rapper control for an electrostatic precipitator, said rapper control comprising:

a plurality of electrostatic precipitator rappers including a plurality of rapper types;

means for switching having a plurality of switches wherein each said rapper is connected to at least one of said switches;

power control means with an output connected to said switch means to vary power to each said rapper, said power control means including a pair of SCRs connected in a predetermined configuration;

current detecting means connected between said power control means and said switch means to sense and measure the peak electrical input current to each said rapper;

a computer with memory means, said computer connected to said current detecting means, to said power control means and to said switch means for storing pre-set open and short circuit fault conditions of each said rapper; and

logic means to control power to each said rapper in a preselected logic sequence, wherein said logic sequence changes said measured peak electrical input current of the rapper being sensed to a digital word representing actual peak rapper input current, retrieves said pre-set open and short fault conditions associated with the rapper being sensed from said memory means, compares said digital word with said retrieved open and short fault conditions to determine if a fault condition is present, and sends information to said power control means to de-energize the rapper that is being sensed upon detection at a fault.

1 Claim

1. An optical system comprising:

(a) an optical disc player; and

(b) an optical disc;

said optical disc including a plurality of tracks comprising a plurality of sectors, each sector including a sector identifier portion having sector address information recorded therein and a data field portion for data recording/reproducing, wherein data is reproduced and/or recorded by irradiating a laser beam onto a light-sensitive recording material formed on the tracks;

said optical disc player including a data recording and reproducing optical head, a linear motor and a track search means for shifting said optical head along said disc by said linear motor to perform a track coarse search operation and a track fine search operation by causing a laser beam emitted by a laser source of the optical head to jump tracks, said player having a characteristic maximum possible number of erroneously searched tracks during said coarse search operation;

said plurality of sectors of said optical disc comprising:

a data read-only area comprising a plurality of first sectors having a said data field portion in which data has been recorded in concave and convex phase structure; and

a data recording/reproducing area comprising a plurality of second sectors having a said data field portion in which data can be recorded, each of said first and second sectors having address information and a data field identification flag recorded in concave and convex phase structure in the sector identifier portion thereof, said flag being set in one of a first state and a second state, said first state indicating that a sector in which a said flag is recorded has a data read-only area and said second state indicating that a sector in which a said flag is recorded has a data recording/reproducing area; and

said optical disk further comprising first and second guard areas interposed between said data read-only area and said data recording/reproducing area, said first guard area comprising a first number of said tracks having a concave and convex phase structure substantially identical to that of said data read-only area and said second guard area comprising a second number of said tracks in which data can be recorded as in said data recording/reproducing area, and both said first number and said second number being greater than said characteristic maximum possible number of erroneously searched tracks of said disk player.

3. A multi-loaded disk drive arrangement comprising:

a rotatable disk table for holding a plurality of disks arranged on the same circumference thereof;

a loading mechanism for rotating a desired disk on said table

so that it is placed at a predetermined recording/reproducing position, and including a loading base comprising a flat surface and ring portion having an annular toothed gear portion and a toothless portion thereon;

a movement mechanism for moving a recording/reproducing unit including an optical head so that it is placed at a recordable/reproducible position below said table;

a single drive source electrically connecting said loading mechanism and said movement mechanism to drive both said mechanisms;

a reduction mechanism connecting said loading mechanism and said movement mechanism, and including gears of plurality of stages;

a cam wheel adapted to move said recording/reproducing unit upward and downward by a cam surface obliquely provided on the outer peripheral surface, a planetary gear rotating between a gear of the final stage of said reduction mechanism and said toothed gear of said loading mechanism being provided in association with said cam wheel; and

a clutch mechanism including an idler adapted to come into contact with an inner tooth gear formed on said disk table and rotate coaxially with said planetary gear, so that when said idler is located at the position of said toothless portion of said loading mechanism, said clutch mechanism helps to drive said drive source to thereby allow said idler to come into contact with said inner tooth gear to rotate said disk table in a clockwise direction or in a counterclockwise direction, while when said idler is meshed with said toothed gear, said clutch mechanism helps to drive said cam wheel connected to said idler to move said recording-/reproducing unit up to a recording/reproducing position to stop said drive source.

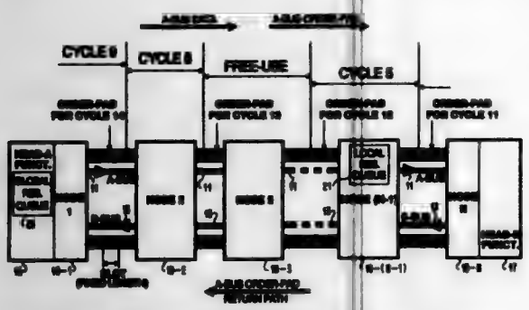
node for reserving time slots, said method of multiple-access control comprising the following steps, for reducing the number of time slots which have to be released:

carrying a furthest destination identification (DST-MAX) in each said order pad, which is updated by each node reserving time slots for data transmission to a selected destination node;

determining, from said furthest destination identification, sections of the transmission bus, each between two of said nodes, beyond which no data have to be transmitted in time slots of the respective cycle;



restarting said request count for each such section, and keeping the maximum value of the request count which occurred for any of said sections, as requested maximum (REQ-MAX) for the respective cycle;

releasing, for each cycle, a number of time slots corresponding to the requested maximum for that cycle; and

reusing, during each cycle, all time slots which pass a node located between any two of said sections which were determined for that cycle.

6. A system for testing a circuit, comprising:
the circuit, said circuit functionally divisible into logical blocks;
a system bus interconnecting said logical blocks;
a test bus;
a test port for use with another test port, comprising:
a scan data input;
logic circuits;
a first scan for module, enable and control bits path fed by said scan data input and comprising a module enable latch;
a second separate scan path for data latch bits fed by said scan data input and comprising serially interconnected data latches connected to predetermined locations of said circuit under test, wherein one of said serially interconnected data latches is connected to said scan data inputs;
a selector circuit with control circuitry connected to said test bus, and fed by said first and second scan paths; and
a scan data output fed by said selector circuit and feeding a scan data input of said another test port; and
a buffer interconnected between said circuit under test and said system bus, wherein said buffer has a first state connecting said circuit under test to said system bus and a second state disconnecting said circuit under test from said system bus;
wherein said test bus comprises control lines feeding said selector circuit and logic circuits in said test port, and clock lines feeding said interconnected data latches.

1. A laser, comprising:

an optical cavity disposed along an optic axis having therein an optical beam composed of longitudinal modes each with a mode phase, said optical cavity further having optical losses;

an excitation means for communicating excitation signals to said optical cavity;

a gain medium located in said optical cavity for receiving said excitation signals and for providing optical gain to said optical beam such that a plurality of said longitudinal modes exceed lasing threshold; and

a resonator assembly positioned within said optical cavity including

a first cavity mirror positioned at a first end of the optical cavity;

a scraper mirror positioned within said optical cavity to receive an optical beam transiting therein and to turn a portion of said optical beam outward from said optical cavity, said scraper mirror having a central aperture along said optic axis and a feedback aperture displaced from said optic axis about a feedback axis;

a second cavity mirror opposed to said first mirror at a second end of the optical cavity along said optic axis registered with said central aperture configured to reflect said optical beam within said optical cavity;

a feedback mirror located along said feedback axis for reflecting a feedback beam transiting between said feedback mirror and said first optical cavity mirror; and

a modelocking means positioned along said feedback axis to receive said feedback beam and provide, in response to control signals, a perturbation in said optical cavity losses as said optical beam transits said optical cavity allowing said optical cavity losses to be lower when longitudinal modes above threshold in the cavity are phase locked so as to produce an optical pulse circulating therein.

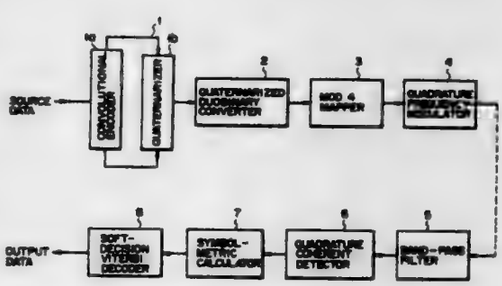
U.S. Cl. 375—17 **3 Claims**



1. A convolutionally-encoded quadrature frequency-modulation (CQFM) system comprising:

encoding means for convolutionally-encoding data from an information source with a rate r=½;

quaternarizing means for quaternarizing two binary outputs from said encoding means to produce a quaternary data;

conversion means for duobinarilly-converting the quaternary data from said quaternarizing means;

mod.4 mapping means for mod.4-mapping the converted data from said conversion means;

modulation means for quadrature frequency-modulating a carrier with output data from said mod.4 mapping means;

detecting means for detecting coherently a received quadrature frequency-modulated signal;

symbol-metric calculating means for calculating Euclidean distances between a received signal point and four nominal signal points in a two-dimensional signal space; and

soft-decision Viterbi decoding means equipped with a signal location pointer, which is a memory of which contents indicate any one of the nominal signal points and are updated at the same time as the contents of the path-history memory and the state-metric memory are updated in accordance with the path selected by the ACS circuit, in order to decode source data at a time from said quadrature frequency-modulated signal by tracking trajectries of the transition between the states of the whole including said encoding means and converting means through the aid of said signal location pointer.

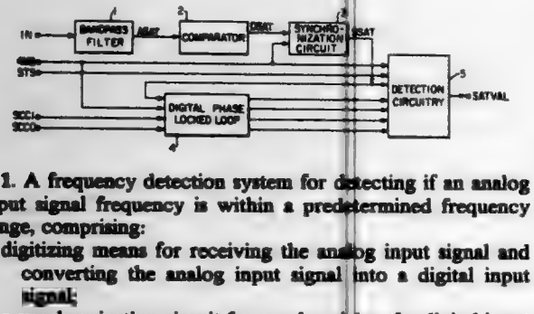
U.S. Cl. 375—81 11 Claims



1. A frequency detection system for detecting if an analog input signal frequency is within a predetermined frequency range, comprising:

digitizing means for receiving the analog input signal and converting the analog input signal into a digital input signal;

a synchronization circuit for synchronizing the digital input signal with a system clock signal and producing a synchronized input signal;

a digital phase locked loop having a selectable center frequency and a bandwidth at least as wide as the predetermined frequency range, the phase locked loop receiving the synchronized input signal and producing a digital output signal having 1st, 2nd, 4th, and 8th harmonics, the digital output signal being produced from the synchronized input signal and having a phase determined by a phase difference between the synchronized input signal and the center frequency;

detector circuit means for detecting whether the synchronized input signal has a frequency within the predetermined frequency range, the detector circuit means including:

(a) a timer responsive to the synchronized input signal, the timer establishing a detection sequence having a beginning and an end;

(b) a first phase detector which counts one edge of the synchronized input signal occurring within a first phase window during the detection sequence, the first phase window being formed from the digital output signal of the digital phase locked loop and located to include the occurrence of one edge of an ideal synchronized signal within the predetermined frequency range, the count in said first phase detector being responsive to the beginning of the detection sequence for resetting the count and responsive to the end of the detection sequence for producing a first status signal, the first status signal indicating whether the count of the one edge counted by the first phase detector exceeds a predetermined minimum count; and

(c) a second phase detector which counts the one edge of the synchronized input signal occurring within a second phase window during the detection sequence, the second phase window being formed by the digital output signal of the digital phase locked loop and located to include another edge of an ideal synchronized signal within the predetermined frequency range, the count in said second phase detector being responsive to the beginning of the detection sequence for resetting the count and responsive to the end of the detection sequence for producing a second status signal, the second status signal indicating whether the count of the edges counted by the second phase detector is less than a predetermined maximum count; and

output means responsive to said first and second status signals for forming a signal indicating that the synchronized input signal is within the detection frequency range when the first and second status signals are both received or the synchronized input signal is not within the detection frequency range when either of the status signals is not received.

Filed Oct. 28, 1991, Ser. No. 783,736
Int. Cl.[5] G01B 15/02
U.S. Cl. 378—50 8 Claims

1. A method for determining the thickness of an aluminide coating deposited on a gas turbine blade using X-ray spectrometry, the turbine blade being formed from a nickel-based, high temperature alloy, the method comprising the steps of:

determining the presence of a boundary layer of substantially pure nickel disposed between the aluminide coating and the turbine blade, the boundary layer being created by leaching of nickel from the nickel-based alloy upon application of the aluminide coating to the blade; and

establishing a secondary radiation emission calibration characteristic for measurement of thickness of the coating using X-ray spectrometry wherein one end point of the characteristic secondary radiation corresponds to secondary radiation from substantially pure nickel.

1. An x-ray monochromator, comprising

a. a base,

b. a housing moveably mounted on the base and having in one side thereof an inlet window and in the other side thereof an outlet window,

c. support means mounted in the housing,

d. a plurality of pairs means, said mirrors defining a plurality of pairs of opposed mirror faces parallel to each other, each of said pair of opposing faces being coated with a multilayer coating, said multilayer coating on each pair of faces being different from the multilayer coatings on the other pairs of faces so that each pair of mirror faces has peak x-ray reflectivity at a different wavelength range,

e. means on the base for moving the support means to bring one face of each pair of mirror faces into the path of a polychromatic beam of x-rays at one angle of incidence, said mirrors being so positioned that the x-ray beam is reflected to the other mirror face of said pair at the same angle of incidence and is reflected from said other mirror face out of the housing through said outlet window, and

f. means on the housing and connected to the mirrors for pivoting the mirrors to change the angle at which the polychromatic beam of x-rays strikes the pair of mirror faces so that the multilayer coatings offer the greatest amount of reflection of the wavelength desired.

14. An active mobile interface capable of connecting between a plurality of telecommunication stations and a plurality of trunks that link to communication carriers of various media, wherein the interface, the telecommunication stations, and the trunk being situated upon a mobile environment, wherein a medium is any of various transmission means to accomplish a connection of an outgoing telephone call between a calling party at the telecommunication station and a called party at a remote location and a communication carrier is the specific agent through which the connection is made, the interface comprising:

(a) station channels that connect to the telecommunication stations;

(b) trunk channels that connect to the trunks that link to the communication carriers of various media, wherein one of the trunk channels is adapted to be connected to a trunk that is applied to a communication medium capable of linking to a plurality of carriers of the same medium;

(c) means for interrogating the trunk channels for availability upon the initiation of the outgoing telephone call originating from one of the telecommunication stations, the availability of a particular trunk channel being variably dependent upon location of the mobile environment and the medium to which the trunk channel is connected;

(d) means for determining the communication medium of least cost according to a preselected hierarchy of the media of communication;

(e) means for routing the telephone call from one of the station channels to the available trunk channel linked to the communication carrier having the medium of least cost;

(f) a memory that contains a lookup table of tariff information that relates to the different carriers of the communication medium capable of linking to the plurality of carriers of the same medium, wherein the lookup table contains rates of the different carriers as affected by the geographic region of the telecommunication stations and the destination of the telephone call; and

(g) means for selecting the communication carrier of least cost upon routing the telephone call to the trunk channel that is adapted to be connected to the trunk that is applied to the communication medium capable of linking to the plurality of carriers of the same medium.

1. In a teleprinting method for periodically transmitting billing data to a user of a meter for measuring service and of allowing the user to control and pay the bill to a supplier of the service at a telephone user, the steps comprising:

collecting service data referred to a service utilized by the user from a user meter associated with a telephone installed at the telephone user to a central processor installed at a supplier location and storing said service data in a memory of said central processor;

processing the service data and a corresponding service rate for the service data stored in the memory of the central processor to obtain a service charge related to a given period of time, including additional charges and taxes;

assembling said service data, service rate and service charge with all other data related to the user and stored in the memory of the central processor and intended to be shown in a bill;

periodically sending through said telephone at the telephone user the assembled data related to the user from the central processor installed at the user location and storing said data in a memory of said remote processor, said assembled data being sent through a communication line;

sending a command from the central processor to the remote processor through said communication line for printing the data stored in said remote processor on a blank bill form available to the user at the supplier location; and

printing the blank bill form supplied by the user to a printing machine, the resulting bill form being the document allowing the user to control the billed data and carry out payment for the service received.

1. In a device for receiving a memorandum board for a telephone wherein said memorandum board includes a handle in the form of a projection projecting therefrom at the foremost end thereof and is slidably displaced in the forward/rearward direction along a pair of guide grooves formed on a bottom plate of the telephone, the improvement comprising:

a pair of engagement holes formed on the memorandum board in the vicinity of the rear end of the memorandum board,

a pair of engagement projections projecting from the memorandum board in the vicinity of the rear end of the memorandum board, said engagement projections being located sideward of said engagement holes,

a pair of first engagement cavities formed on the bottom plate of the telephone so as to allow said engagement projections on the memorandum board to be brought into engagement with said first engagement cavities thereby to hold the memorandum board in the operative state wherein the membrandum board is pulled in the forward direction with a user's fingers,

a pair of second engagement cavities formed on the bottom plate of the telephone so as to allow said engagement projections on the memorandum board to be brought into engagement with said second engagement cavities thereby to hold the memorandum board in the intermediate state wherein the memorandum board is intermediately received in the region below the bottom plate of the telephone while the handle is still exposed to the outside, and

a pair of stoppers projecting on the bottom plate of the telephone so as to allow said engagement holes on the memorandum board to be brought into engagement with said stoppers in the inoperative state wherein the whole memorandum board, inclusive of the handle, is fully received in the region below the bottom plate of the telephone.

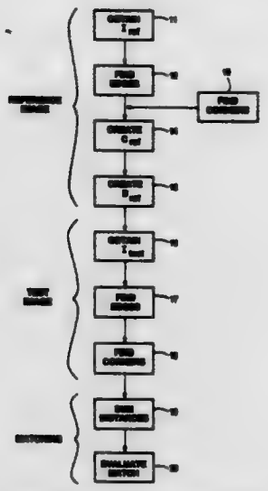
CORNER-BASED IMAGE MATCHING

Kashipati G. Rao, Dallas, Tex., assignor to Texas Instruments Incorporated, Dallas, Tex.

Filed May 31, 1991, Ser. No. 708,592
Int. Cl.[5] G06K 9/46
U.S. Cl. 382—22 17 Claims



1. A method of matching a test image to a reference image, comprising the steps of:

determining the edge boundaries of a reference image;

determining corners of said edge boundaries of said reference image;

calculating a distance array, representing distances of each array location to the nearest of said corners;

determining the edge boundaries of a test image;

determining corners of said edge boundaries of said test image;

using said distance array to determine the test distance of each corner of said test image from a corner of said reference image; and

evaluating said test distances to determine the degree of matching between said reference image and said test image.

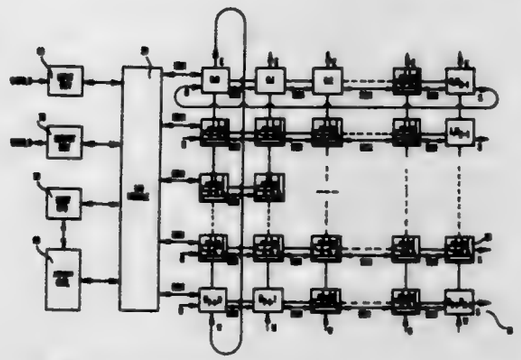
36. A method for gathering and manipulating data relating to a position and configuration of an object in a three-dimensional space extending a characteristic number N_x of voxels in an x-dimension and a characteristic number N_y of voxels in a y-dimension, comprising the steps of:

sensing portions of said object;

generating an indication for the voxel at each x,y,z whether said portion occupies said voxel;

storing said indication in a rectangular N_x by N_y array of processing cells each uniquely associated with a respective pair of coordinates x,y and having a memory capable of storing an indication of whether said portion occupies a voxel having coordinates x,y,z at a zth address in said memory, at said zth address of said memory of said cell associated with said coordinate pair x,y; and



controlling further data storage in and between said cells in such a manner as to correspond to operations on said object in said space.

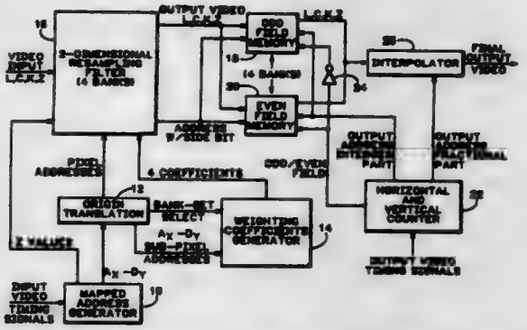
VIDEO IMAGE MAPPING SYSTEM

Raymond C. Blackham, Penn Valley, and Frank S. Lawrence, Grass Valley, both of Calif., assignors to The Grass Valley Group, Inc., Nevada City, Calif.

Filed Mar. 29, 1991, Ser. No. 677,548
Int. Cl.[5] G06K 9/32
U.S. Cl. 382—44 20 Claims



1. A method for mapping a video image in a first two-dimensional plane into a video image in a second two-dimensional plane according to an arbitrary mapping function, the method comprising the steps of:

mapping addresses of the video image in the first two-dimensional plane into the second two-dimensional plane to produce quadrilateral addresses;

translating an origin to produce sub-pixel addresses, pixel addresses and bank-set selection signals from the quadrilateral addresses;

generating weighting coefficients indicative of an area of a quadrilateral that is within each of a plurality of banks, the weighting coefficients being generated from the bank selection signals and the sub-pixel addresses;

using the generated coefficients and the pixel addresses to produce video data and video addresses in the second two-dimensional plane; and

organizing the video data and video addresses in the second two-dimensional plane to produce the video image in the second two-dimensional plane.

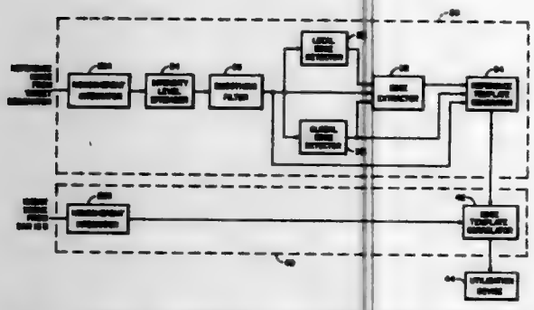
Int. Cl.[5] G06K 9/20
U.S. Cl. 382—48 2 Claims



1. In a system for aligning two images of the same scene, each of such images comprising an array of pixels, a method of forming a template of a portion of the first image for comparison to the second image, said method comprising the steps of:

(a) forming a first map from a portion of the first image, the first map comprising an array of pixels, each pixel in the first map having a value indicating whether the corresponding pixel in the first image represents the edge of an object in the range; and

(b) assigning a first value to each pixel in a template map corresponding to pixels on the first map having values indicating an edge and corresponding to pixels in the image having values above a predetermined threshold, and assigning a second value to each pixel in the template corresponding to pixels in the first map having values indicating an edge and corresponding to pixels in the image having values below a predetermined threshold; and

(c) computing a correlation threshold according to the formula:

$$CR\ (\ln CR)/(CR-1)$$

where CR represents the ratio of the average value of the pixels in the first image corresponding to pixels in the template map with the first value to the average value of the pixels in the first image corresponding to pixels in the template map with the second value.

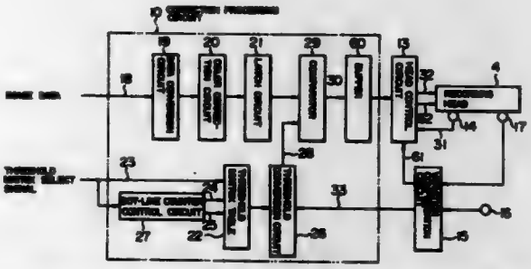
1. A color image transferring method using a threshold matrix table in which threshold matrix data for defining the tone of color image data to be transferred on a recording paper are arranged two-dimensionally corresponding to dots constituting said image data, said dots are compared with the threshold values, and on the basis of the comparison result, the image data with the tone adjusted are transferred on the recording paper, comprising the steps of:

selecting threshold matrix data corresponding to the dots constituting the image data having the tone to be transferred from said threshold matrix data table;

selecting first threshold conversion curve previously defined from a threshold conversion circuit corresponding to the tone of said selected threshold matrix data;

correcting said selected first threshold conversion curve using a second threshold conversion curve selected from second threshold conversion curves previously defined in said threshold conversion circuit on the basis of a mechanical and electrical variations in a color image transferring apparatus;

converting said threshold matrix data selected by said



threshold conversion circuit into threshold data on the basis of said selected second threshold conversion curve;

comparing the threshold data with dots corresponding to single line of said image data thereby to produce a binary-digitized image signal with "1" or "0" according to as said single line of dots is larger or smaller than said threshold data; and

supplying the binary-digitized image signal produced to a transferring head to be transferred on said recording paper.

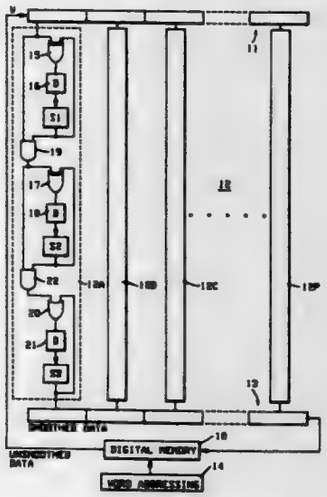
WORD ORIENTED IMAGE SMOOTHING APPARATUS AND METHOD

Donald H. McMahon, Gasevoort, N.Y., assignor to Unisys Corporation, Blue Bell, Pa.

Filed Oct. 10, 1991, Ser. No. 774,484
Int. Cl.[5] G06K 9/44
U.S. Cl. 382—54 9 Claims



1. Apparatus for smoothing a two-dimensional image represented by a matrix of pixels arranged in a plurality of adjacent scan lines, each said pixel having a predetermined neighborhood of adjacent pixels defining adjacent neighboring pixels, said matrix of pixels being represented by a sequence of digi-

tally stored words having N bits each, each said bit representing a corresponding pixel of said matrix, comprising

register means having N bit positions for holding an N-bit word,

N counter means coupled to said N bit positions of said register means, respectively, for accumulating the number of ONEs existing in said N bit positions of said register means, respectively,

each said counter means comprising a plurality of counter stages including a most significant stage, said N counter means thereby including most significant stages, respectively,

each said counter means being constructed and arranged so that said most significant stage thereof goes to ONE when said counter means has accumulated a predetermined number of ONEs and remains at ONE irrespective of further accumulation of ONEs, and

control means operative to load a word under examination into said register means, said word under examination being N pixels under examination, said control means being further operative to load further words into said register means representing N pixels adjacent said N pixels under examination on scan lines adjacent said N pixels under examination, said control means being further operative to shift said word under examination and said further words, said control means being operative such that said word under examination and said further words are sequentially loaded into and shifted in said register means one word at a time so that ONEs representing said N pixels under examination and said adjacent neighboring pixels thereof are simultaneously accumulated in said N counter means, respectively, with said most significant stages of said N counter means containing a smoothed word corresponding to said word under examination.

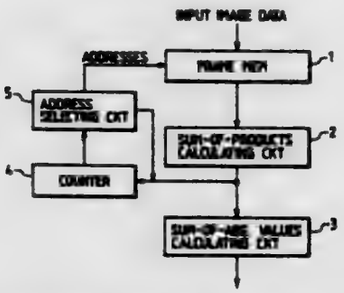
Int. Cl.[5] G06K 9/40
U.S. Cl. 382—54 2 Claims



1. An image filtering system comprising:

storage means for storing image data representing an entire input image therein, the image data being partitioned into blocks for an orthogonal transform, each of the blocks being composed of a predetermined number of picture elements;

address selecting means for selecting addresses of said storage means, from which image data corresponding to respective object regions and stored at the selected addresses are read, each of said object regions being a predetermined region of a frame; and

sum-of-products calculating means for multiplying each of the image data of picture elements read out of said storage means by a corresponding coefficient of an operator, which is comprised of a predetermined number of coefficients, for adding up the thus obtained products for each of the object regions and for outputting a sum signal representing a sum of the products for each of the object regions,

wherein said address selecting means selects the addresses such that a storage area of said storage means corresponding to each of the object regions does not spread over adjoining ones of the blocks, and

wherein said address selecting means comprises:

counter means for receiving the sum signals from said sum-of-products calculating means, for increasing a count by 1 every reception of the sum signal, for storing the increased count therein and for outputting a shift signal when the count is increased by 1; and

address shifting means for receiving the shift signal from said counter means, for shifting a start address, from which a reading of image data is started, by a predetermined amount in response to the shift signal, for generating addresses of picture elements corresponding to an object region to next be accessed unless a storage area of said storage means corresponding to the object region include boundary picture elements of both of the adjoining blocks, and for issuing to said counter means an incrementing signal for increasing the count stored in said counter means without generation of addresses if the storage area of said storage means corresponding to the object region includes the boundary picture elements of both of the adjoining blocks, said counter means increasing the count by 1 in response to the incrementing signal.

33. An optical isolator comprising:

a first polarizer to transmit light which is polarized in a predetermined direction;

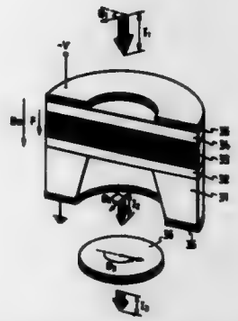
a substrate;

a first clad layer having a first polarity formed on the substrate;

a waveguide layer which is formed on the first clad layer and has a quantum well structure into which light which is transmitted in the first polarizer enters, in which the waveguide layer is formed by alternately laminating a well layer and a barrier layer and at least the barrier layer in said layers contains magnetic ions and the waveguide layer propagates the incident light and rotates a polarizing direction of the incident light which it emits;

a second clad layer which is formed on the waveguide layer and has a polarity opposite to the first polarity;

electrodes to apply an electric field to the waveguide layer, in which when the electric field is applied to the wave-



guide layer, a degree of leakage of a wave function of a carrier in the well layer into the barrier layer changes and an effective magnetic field which a carrier spin feels changes by an exchange interaction between the carrier spin and a magnetic moment associated with the magnetic ions, so that a rotation angle in the polarizing direction of the emission light changes; and

a second polarizer to transmit the light which is emitted from the waveguide layer.

PATENT AND TRADEMARK OFFICE NOTICES

Patent Cooperation Treaty (PCT) Information

For information concerning PCT member countries, see the notice appearing in the *Official Gazette* at 1142 O.G. 66, on Sept. 29, 1992.

For use of the European Patent Office as an International Searching Authority for international applications filed in the United States Receiving Office, see the notice appearing in the *Official Gazette* at 1022 O.G. 52, on Sept. 28, 1982.

For use of the European Patent Office as an International Preliminary Examining Authority for international applications filed in the United States Receiving Office, see the notices appearing in the *Official Gazette* at 1080 O.G. 2, on July 7, 1987 and at 1091 O.G. 2, on June 7, 1988. There is no longer a limit on the number of such international applications accepted for international preliminary examination by the European Patent Office; see the notice appearing at 1116 O.G. 32, on July 17, 1990.

The search fee of the European Patent Office was changed on Oct. 1, 1992, due to changes both in the amount of the international search fee charged by the European Patent Office and in the exchange rate of the U.S. dollar to the German mark, and was announced in the *Official Gazette* at 1142 O.G. 20, on Sept. 8, 1992.

International fees, effective on Dec. 1, 1992, due to changes in the exchange rate of the U.S. dollar with regard to the Swiss franc, were announced in the *Official Gazette* at 1143 O.G. 62, on Oct. 27, 1992.

Certain domestic PCT fees and charges for International Search and Preliminary Examination have been changed effective Oct. 1, 1992 and were announced in the *Official Gazette* at 1141 O.G. 68 on Aug. 25, 1992.

Notice of Maintenance Fees Payable

Title 37, Code of Federal Regulations, Section 1.362(d) provides that maintenance fees may be paid without surcharge for a six-month period beginning 3, 7, and 11 years after the date of issue of patents based on application filed on or after Dec. 12, 1980. An additional six-month grace period is provided by 35 U.S.C. 41(b) and 37 CFR 1.362(e) for payment of the maintenance fee with the surcharge set forth in 37 CFR 1.20(h), as amended effective Dec. 16, 1991. If the maintenance fee is not paid in a patent requiring such payment the patent will expire on the 4th, 8th or 12th anniversary of the patent.

Attention is drawn to the patents which were issued on December 26, 1989 for which maintenance fees due at 3 years and six months may now be paid. The patents have patent numbers within the following ranges:

Utility Patents 4,888,825 through 4,890,334
Reissue Patents based on the above identified patents.

Attention is drawn to the patents which were issued on December 24, 1985 for which maintenance fees due at 7 years and six months may now be paid. The patents have patent numbers within the following ranges:

Utility Patents 4,559,646 through 4,561,120
Reissue Patents based on the above identified patents.

No maintenance fees are required for design or plant patents.

Payments of maintenance fees in patents should be directed to "Commissioner of Patents and Trademarks, Box M. Fee, Washington, D.C. 20231."

For patents based on applications filed on or after December 12, 1980, but before August 27, 1982, patent owners must establish small entity status according to 37 CFR 1.27 if they have not done so and if they wish to pay the small entity.

The current amounts of the maintenance fees due at 3 years and six months and seven years and six months and eleven years and six months are set forth in 37 CFR 1.20(e)-(g), as amended Oct. 1, 1992, which are reproduced below:

37 CFR § 1.20 Post-issuance fees

(e) For maintaining an original or reissue patent, except a design or plant patent, based on an application filed on or after after Dec. 12, 1980 , in force beyond 4 years; the fee is due by three years and six months after the original grant:

By a small entity (§ 1.9f) $465.00
By other than a small entity $930.00

(f) For maintaining an original or reissue patent, except a design or plant patent, based on an application filed on or after Dec. 12, 1980 in force beyond 8 years; the fee is due by seven years and six months after the original grant:

By a small entity (§ 1.9f) $935.00
By other than a small entity $1,870.00

(g) For maintaining an original or reissue patent except a design or plant patent, based on an application filed on or after Dec. 12, 1980, in force beyond 12 years; the fee is due by eleven years and six months after the original grant:

By a small entity(§ 1.9(f)) $1,410.00
By other than a small entity $2,820.00

The amounts of the surcharges for paying the maintenance fee during the grace period or after the expiration of the patent are set forth in 37 CFR 1.20(h), and (i), which are reproduced below:

(h) Surcharge for paying a maintenance fee during the 6-month grace period following the expiration of three years and six months , seven years and six months, and eleven years and six months after the date of the original grant of a patent based on an application filed on or after Dec. 12, 1980

By a small entity (§ 1.9f) $65.00
By other than a small entity $130.00

(i) Surcharge for accepting a maintenance fee after expiration of a patent for non-timely payment of a maintenance fee where the delay is shown to the satisfaction of the Commissioner to have been unavoidable $620.00

Notice of Expiration of Patents Due to Failure to Pay Maintenance Fees

35 U.S.C. 41 and 37 CFR 1.362(g) provide that if the required maintenance fee and any applicable surcharge are not paid in a patent requiring such payment, the patent will expire at the end of the 4th, 8th, or 12th anniversary of the grant of the patent depending on the first maintenance fee which was not paid.

According to the records of the Office, the patents listed below have expired due to failure to pay the required maintenance fee and any applicable surcharge.

Notice of Expiration of Trademark Registrations Due to Failure to Renew

15 U.S.C. 1059 provides that each trademark registration may be renewed for periods of ten years from the end of the expiring period upon payment of the prescribed fee and the filing of an acceptable application for renewal. This may be done at any time within six months before the expiration of the period for which the registration was issued or renewed, or it may be done within three months after such expiration on payment of an additional fee.

According to the records of the Office, the trademark registrations listed below are expired due to failure to renew in accordance with 15 U.S.C. 1059.

Reclassification Alert Report

This report is a summary of classification changes which became effective by issuance of Classification Orders from Oct. through Dec. 1992. Information includes:

- subclasses established or abolished (major changes)
- subclass title, indent, or position change
- changes to existing classes and subclass definitions (minor changes)

This Reclassification Alert Report may appear from time to time in the *Official Gazette* and is intended to provide an interim notice of classification changes pending publication of the Manual of Classification and revisions thereto.

The gerneral public may purchase copies of Classification Orders or Classification Definitions by contacting the Editorial Division at 703-305-6101 or 703-305-5099. Payment can be made through a Deposit Account or by check made payable to "Commissioner of Patents and Trademarks" and sent to:

Applicants with inquiries concerning the status of their applications and a touch tone telephone should call (703) 305-8747 through 305-9752 from 6:30 A.M. to Midnight Est, Monday thru Friday. This automated voice system will provide the current status of your application. Applicants are urged not to file unnecessary inquires concerning the status of their applications. See Section 411 of the *Trademark Manual of Examining Procedure.*

* These dates identify the oldest unassigned new case in each law office. All cases with earlier dates have either been examined and made the subject of an action or are currently being worked on by the assigned examiner.

SPECIAL BOXES FOR MAIL

Special PTO mail box numbers should be used to allow forwarding of particular types of mail to the appropriate areas as quickly as possible. Such mail is forwarded directly to the appropriate area without being opened. Only the specified type of document should be placed in an envelope addressed to one of these boxes. If any documents other than the specified type identified for each box are addressed to that box, they will be delayed in reaching the appropriate area for which they are intended.

The following special boxes should be used only for their specified purpose. Address mail as follows:

Box _____

Reference Collections of U.S. Patents and Trademarks
Available for Public Use in Patent and Trademark Depository Libraries

The following libraries, designated as Patent and Trademark Depository Libraries (PTDLs), receive patent and trademark information in various formats from the U.S. Patent and Trademark Office. Many PTDLs have on file all full-text patents issued since 1790, trademarks published since 1872, and select collections of foreign patents. All PDTLs have both the patent and trademark sections of the *Official Gazette of the U. S. Patent and Trademark Office*. The full-text utility and design patents are distributed numerically on 16 mm microfilm, and plant patents on color microfiche. Patent and trademark search systems on CD-ROM (Compact Disc-Read Only) format are available at all PTDLs to increase utilization of and enhance access to the information found in patents and trademarks. It is through the CD-ROM systems that preliminary patent and trademark searches can be conducted through the numerically arranged collections.

All information is available for use by the public free of charge.

In addition, each PTDL offers reference publications which outline and provide access to the patent and trademark classification systems, as well as other documents and publications which supplement the basic search tools. PTDLs provide technical staff assistance in using all materials. Facilities for making paper copies of patent and trademark information are generally provided for a fee.

Since there are variations in the scope of patent and trademark collections among the PTDLs, and their hours of service to the public vary, anyone contemplating use of these collections at a particular library is urged to contact that library in advance about its collections, services, and hours in order to avert possible inconvenience.

MARKS PUBLISHED FOR OPPOSITION

The following marks are published in compliance with section 12(a) of the Trademark Act of 1946. Applications for the registration of marks in more than one class have been filed as provided in section 30 of said act as amended by Public Law 772, 87th Congress, approved Oct. 9, 1962, 76 Stat. 769. Opposition under section 13 may be filed within thirty days of the date of this publication. See rules 2.101 to 2.105.

A separate fee of two hundred dollars for opposing each mark in each class must accompany the opposition.

SECTION 1.—INTERNATIONAL CLASSIFICATION

The short titles associated below with the international class numbers are terms designed merely for quick identification and are not an official part of the international classification. The full names of international classes are given in section 6.1 of the trademark rules of practice.

The designation "U.S. Cl." appearing in this section refers to the U.S. class in effect prior to Sep. 1, 1973 rather than the international class which applies to applications filed on or after that date. For adoption of international classification see notice in the OFFICIAL GAZETTE of Jun. 26, 1973 (911 O.G. TM 210).

SECTION 2.—INTERNATIONAL CLASSIFICATION

The short titles associated below with the international class numbers are terms designed merely for quick identification and are not an official part of the international classification. The full names of international classes are given in section 6.1 of the trademark rules of practice.

The designation "U.S. Cl." appearing in this section refers to the U.S. class in effect prior to Sep. 1, 1973 rather than the international class which applies to applications filed on or after that date. For adoption of international classification see notice in the OFFICIAL GAZETTE of Jun. 26, 1973 (911 O.G. TM 210).

SECTION 1.—INTERNATIONAL CLASSIFICATION

The short titles associated below with the international class numbers are terms designed merely for quick identification and are not an official part of the international classification. The full names of international classes are given in section 6.1 of the trademark rules of practice.

The designation "U.S. Cl." appearing in this section refers to the U.S. class in effect prior to Sep. 1, 1973 rather than the international class which applies to applications filed on or after that date. For adoption of international classification see notice in the OFFICIAL GAZETTE of Jun. 26, 1973 (911 O.G. TM 210).

TRADEMARK REGISTRATIONS ISSUED UNDER SECTION 1(d)

The following marks have registered on the Principal Register pursuant to the intent-to-use provisions of Section 1(d) of the Trademark Act of 1946, as amended.

SECTION 1.—INTERNATIONAL CLASSIFICATION

The short titles associated below with the international class numbers are terms designed merely for quick identification and are not an official part of the international classification. The full names of international classes are given in section 6.1 of the trademark rules of practice.

The designation "U.S. Cl." appearing in this section refers to the U.S. class in effect prior to Sep. 1, 1973 rather than the international class which applies to applications filed on or after that date. For adoption of international classification see notice in the OFFICIAL GAZETTE of Jun. 26, 1973 (911 O.G. TM 210).

SECTION 2.—INTERNATIONAL CLASSIFICATION

The short titles associated below with the international class numbers are terms designed merely for quick identification and are not an official part of the international classification. The full names of international classes are given in section 6.1 of the tradesmark rules of practice.

The designation "U.S. Cl." appearing in this section refers to the U.S. class in effect prior to Sep. 1, 1973 rather than the international class which applies to applications filed on or after that date. For adoption of international classification see notice in the OFFICIAL GAZETTE of Jun. 26, 1973 (911 O.G. TM 210).

TRADEMARK REGISTRATIONS AMENDED, CORRECTED, ETC.

The designation "U.S. Cl." appearing in this section refers to the U.S. class in effect prior to Sep. 1, 1973 rather than the international class which applies to applications filed on or after that date. For adoption of international classification see notice in the OFFICIAL GAZETTE of Jun. 26, 1973 (911 O.G. TM 210).

Any change to the registration will be indicated at the bottom of each entry under ELEMENTS AMENDED, CORRECTED OR RESTRICTED. With the exception of changes to the goods and services, additions to the registration will appear in asterisks and deletions of the registration will appear in brackets. Elements which are only changed will be listed with no punctuation. As to the goods/services statement, amendments to the goods/services will appear in asterisks and deletions will appear in brackets. In addition if any change to the goods/services occurs, the element "Goods/Services" will be listed under ELEMENTS AMENDED, CORRECTED OR RESTRICTED.
